THE ALL-IN-ONE SEWER NETWORK MONITORING PLATFORM

Four line items. One subscription. Here is the arithmetic.

Monitoring analytics, network modelling, alerting and the recurring infiltration study are sold to Australian water authorities as four separate purchases. EDS FlowSense is the all-in-one platform that covers all four in one subscription, priced only by the site at $20 to $30 per site per month. This document sets that against the prices the market publishes. It shows its working on every comparison and says plainly what the figures do not cover.

VALUE ANALYSIS PUBLISHED RATE CARD COMPARATORS PRICED FROM PUBLIC DOCUMENTS

COMPANION TO THE CAPABILITY BROCHURE OCTOBER 2026

THE SHAPE OF THE MARKET

Doing this properly today means buying four things.

These are the published prices for the pieces a wastewater monitoring programme is normally assembled from. Two of the platforms most often shortlisted against FlowSense publish no price at all. That is worth noticing: a price you can only discover through a sales cycle is itself a cost.

LINE ITEM 01

Analytics portal

H2Ometrics Advanced (US)	about A$130 per meter/mo
User cap on that tier	10 users
H2Ometrics Basic (US)	about A$31 per meter/mo
Basic tier scope	Hosting and scatter plots
ADS PRISM access (US)	about A$39 per meter/mo

LINE ITEM 02

Modelling seat

InfoWorks ICM Sewer	about A$8,500 per seat/yr
Bentley SewerGEMS	about A$11,700 per seat/yr
DHI MIKE+ Collection	about A$15,300 per seat/yr
ICM Ultimate	from A$27,700 per seat/yr
Each seat covers	1 user

LINE ITEM 03

Alerting layer

Kallipr Kloud	Not published
StormHarvester	Not published
Getting a price means	A sales cycle

LINE ITEM 04

The infiltration study

Delivered as	A consultant report
Arrives	Months after the data
Running it again	A new engagement

There is a fifth way to buy, for completeness: full service monitoring programmes that bundle hardware, field crews and software. Public United States municipal agreements put these at about A$285 per site per month for level monitoring (SmartCover, City of Beaumont). They put full flow monitoring service at about A$1,570 per site per month (ADS, City of Cartersville). Those figures include instruments and labour, so they are kept out of the software comparisons that follow. FlowSense prices the software. Instruments are purchased separately, from any vendor whose loggers you already run.

The capability by capability comparison with ADS, Kallipr and StormHarvester is its own document. This one is only about money and what the money buys.

ONE LINE ITEM

The whole platform, priced by the site.

There are no editions, no modules, no per user fees and no per report fees. The only number that moves is how many sites you monitor. The bands are cumulative, and growing the network never re-prices the sites you already have.

SUBSCRIPTION RATES, AUD EXCLUDING GST

BAND	PER SITE PER MONTH	PER SITE PER YEAR
First 20 sites	$30	$360
Sites 21 and beyond	$20	$240

WHAT THAT MEANS FOR A REAL NETWORK

NETWORK	SITES	PER YEAR	PER MONTH	BLENDED PER SITE PER MONTH
Small shire	5	$1,800	$150	$30
Regional council	20	$7,200	$600	$30
Mid size council	50	$14,400	$1,200	$24
Large regional network	90	$24,000	$2,000	$22
Bulk utility	300	$74,400	$6,200	$21

A site is a monitored location with at least one active channel, and archived sites cost nothing. Billing is annual, on twelve month terms. You can cancel at renewal, and your data exports with you in full. The only pass through is SMS alerting at carrier cost.

Here is how the fifty site price is built. The first 20 sites at $30 come to $600 a month. The other 30 sites at $20 come to $600 a month. Together that is $1,200 a month, or $14,400 a year.

$0
per user, per report, per export. Sites are the only meter.

100%
of platform capability in every subscription, no editions

90 days
free trial on your own uploaded history, no hardware needed

12 mo
terms, cancel at renewal, no lock in contract

THE WORKED EXAMPLE

A fifty site council, side by side.

Fifty sites is a mid size regional council. The stack column below prices each category at the published tier that does the same work. The two items with no published price are left out of the total rather than guessed at, so the comparison is conservative.

ANNUAL COST, 50 MONITORED SITES, AUD

LINE ITEM	ASSEMBLED FROM PUBLISHED PRICES	EDS FLOWSENSE
Analytics on 50 meters	About A$78,000: 50 meters at about A$130 per meter per month, with users capped at 10 on that tier	Included
Network modelling	A$8,500: one InfoWorks ICM Sewer seat, the cheapest of the four published modelling comparables, licensed to one user	Included: RTK calibration to EPA/600/R-15/162A with CIWEM standard verification, and a dynamic wave model of the whole network, run in the platform and exportable to SWMM
Alerting layer	Quotation only, not counted in this total	Included: threshold, no data, blockage and pump condition early warning, email and SMS at carrier cost
Infiltration study	Separate consultancy engagement, not counted in this total	Included: six heat map methods on the real gravity network, re-run whenever the data changes
Total per year	**About A$86,500 (A$78,000 plus A$8,500), before the two items that could not be counted**	**$14,400, everything above, unlimited users**

> On published prices the assembled stack costs about six times the FlowSense subscription at fifty sites. Over five years the gap is about A$360,000, before the items nobody would publish a price for.
>
> A$86,500 VERSUS $14,400 PER YEAR, SOURCES LISTED AT THE END

The ratio holds across network sizes because the comparison is structural, not a promotional discount. Each row below is the same stack: analytics at about A$130 per meter per month for a year, plus one ICM Sewer seat.

THE SAME STACK AT THREE NETWORK SIZES, AUD PER YEAR

SITES	ANALYTICS, METERS × A$130 × 12	ICM SEWER SEAT	STACK TOTAL	EDS FLOWSENSE	RATIO
20	A$31,200	A$8,500	about A$39,700	$7,200	about 5.5 times
50	A$78,000	A$8,500	about A$86,500	$14,400	about 6 times
90	A$140,400	A$8,500	about A$148,900	$24,000	just over 6 times

Per meter per month at fifty sites, the reading is about A$130 against a blended $24. At ninety sites there is also a comparison that needs no stack at all. **The entire FlowSense subscription, every module, unlimited users, costs less than a single seat of the modelling software it can calibrate.** It is $24,000 a year, against about A$27,700 for one ICM Ultimate licence.

One convergence is stated rather than hidden. At the entry tier, H2Ometrics Basic at about A$31 per meter per month sits close to our own top band rate of $30. The difference there is scope, not price. That tier is data hosting, scatter plots and rainfall tools. The FlowSense rate carries the analytics, the engineering workspaces, the alerting and the report suite in the same number.

VALUE THE INVOICE DOES NOT SHOW

Six differences you can put a number on.

Time to the first ranked answer

The free trial runs for 90 days at $0, on last winter's CSV exports, and produces an infiltration ranking the same afternoon. The consultancy route delivers the equivalent finding months after the data was collected, and delivers it once.

Procurement effort

At fifty sites, $14,400 sits under the $15,000 threshold most Queensland councils hold for small contractual arrangements. That means one quote and a delegated signature, not a procurement round. Even a 300 site network at $74,400 sits below every tender threshold in the country.

Crew days not wasted on bad data

On its first production run, Blockage Watch separated one genuine finding from eight instrument artefacts that would otherwise have outranked it. It routed the eight to data quality, not to a jetting crew. It can also reach a verdict a level only product cannot: increased load, not an obstruction, so no jetting is needed.

Users and seats

Every FlowSense user is $0, across seven access roles with per page grants you administer yourself. The published comparables cap the analytics tier at 10 users. They license modelling per seat, at A$8,500 to A$27,700 per year. On that basis, your eleventh user costs more than your whole subscription.

The study you can re-run

The calibration capability is included in the subscription, and you can run it yourself. If you would rather EDS did the work with you, the Optional EDS Guided Calibration Service is $7,500 per catchment. It covers RTK rainfall response model calibration with CIWEM standard verification. Every storm is scored against published bands: peak within 15% below to 25% above observed, and volume within 10% below to 20% above. It is delivered in the platform where you can re-run it, not as a PDF that ages.

Exit cost

$0. Terms run twelve months and you can cancel at renewal. Your data exports with you in full, and staged imports carry a 30 day undo. A platform confident about its renewal does not need a lock in clause, so there is none.

WHERE THE DEPTH IS

What the subscription number actually contains.

The rate card is only credible if the capability behind it is real. These figures are drawn from the production platform, not a roadmap.

15
modelling modules, project and scenario based, on a GIS canvas

6
selectable infiltration heat map methods, plus a kriging confidence overlay

8
blockage signatures across level and velocity, mechanism named

7
report templates under your own branding, PDF and CSV

2×
daily Blockage Watch runs across the whole network

7
access roles with per page grants, administered by you

5
inbound paths for your own SCADA, plus 3 outbound into your systems

The chain matters more than the count. FlowSense takes a reading from the chamber through five stages: rainfall derived infiltration and inflow (RDII) quantified in kilolitres, dry weather flow profiling, hydraulic QA, network constrained infiltration mapping, and a dynamic wave model of the network itself. It finishes at **discounted cost**

per kilolitre of infiltration removed, with net present value (NPV) and benefit cost ratio. That is the figure that gets a capital project funded. In the assembled stack it only arrives inside a consultant's report. Here it comes out of the same audit trail that started at the sensor. Every calculated number on the screen carries a note showing how it was computed, with the constants imported from the code that does the computing.

Integration is included in the same number, and it runs both ways.

Outbound, FlowSense sends CSV over SFTP or FTPS, or JSON or CSV by MQTT publish, readable by any modern SCADA. Delivery watermarks move forward only after a fully successful send.

Inbound, your own SCADA can feed the platform five ways. It can post readings to us. We can subscribe to your MQTT broker, poll your API or your supplier's cloud, or collect historian CSV exports from your SFTP. Or your historian can upload them to a folder we host. The post and the upload need nothing opened on your side.

That inbound half is the one to check the other quotes for. A platform that will not accept your control room data leaves you maintaining two versions of the same network, and the second one usually gets maintained in a spreadsheet.

SAID PLAINLY

What these figures do not say.

CURRENCY CONVERSIONS ARE APPROXIMATE

Comparator prices are converted at about A$1.54 per US dollar and A$1.70 per euro and rounded. They are indicative context, not quotations. The EDS rates are the current founding rate card in Australian dollars excluding GST, and they are the rates we will quote.

COMPARATORS ARE PRICED FROM PUBLIC DOCUMENTS

Published price lists and public municipal contract attachments as at August 2026. "Not published" means we could not find a price in that vendor's public material, not that no price exists. Where a vendor publishes one, we will use it and correct this document.

HARDWARE IS A SEPARATE PURCHASE

FlowSense prices the software. Instruments are bought separately, once, from the vendor of your choice. The platform reads loggers from multiple vendors, with three vendor telemetry platforms live in production today and staged CSV import for the rest of the market. That is also why the full service programme prices of A$285 to A$1,570 per site per month were left out of the worked example: they bundle hardware and field labour.

WE DO NOT BORROW PERFORMANCE FIGURES

Blockage detection precision is quoted only once cases have been closed with recorded outcomes on your own network, never as a headline borrowed from someone else's deployment. Velocity based signatures need velocity instrumentation. On our production network in August 2026, 37 of 91 sites had it. Sites without it are assessed on level alone, at lower confidence.

NEXT STEP

Check the arithmetic on your own network.

Tell us your site count and we will put your number beside every comparison in this document, on one page. Or skip the reading. The 90 day trial runs on your own uploaded flow history, costs nothing, and produces your infiltration ranking the same afternoon.

–SUBSTANTIATION AND SOURCES

1. H2Ometrics published pricing, h2ometrics.com/pricing, accessed August 2026: Advanced US$85 per meter per month capped at ten users, Basic US$20 per meter per month.
2. ADS Environmental Services annual flow monitoring proposal, City of Cartersville, Georgia, public council agenda attachment: US$1,022 per monitor month full service and US$25 per monitor month for PRISM software access, US$118,688 total for twelve months.
3. SmartCover Comprehensive Monitoring Service Program agreement, City of Beaumont, California, public council agenda attachment: eight units over three years, US$59,995 total, stated by the vendor as equivalent to US$185 per unit per month.
4. Autodesk InfoWorks ICM subscription options and published pricing, autodesk.com One Water blog and product pages, accessed August 2026: ICM Sewer US$5,500 per seat per year, ICM Ultimate from US$18,000 per seat per year.
5. Bentley OpenFlows SewerGEMS Virtuosity subscription pricing as listed by authorised resellers, accessed August 2026: about US$7,600 per seat per year.
6. DHI MIKE+ Collection Systems subscription package pricing, dhigroup.com, accessed August 2026: 9,000 euros per seat per year.
7. Kallipr Kloud and StormHarvester platform pricing: not published in either vendor's public material as at August 2026, available by quotation.
8. CIWEM Urban Drainage Group, Code of Practice for the Hydraulic Modelling of Urban Drainage Systems, 2017 edition, Part C: the source of the peak and volume verification bands quoted in this document.
9. US EPA/600/R-15/162A, the RTK unit hydrograph methodology FlowSense calibrates to, SWMM compatible.
10. EDS FlowSense capability figures, production run results and velocity coverage counts are drawn from the EDS FlowSense platform capability breakdown, August 2026, re-checked against the production codebase on 9 October 2026. The velocity coverage count is as at August 2026.
11. EDS FlowSense subscription rates are the founding rate card, September 2026, in Australian dollars excluding GST.

Worked example arithmetic.

Stack at 50 sites: 50 × A$130 × 12 = A$78,000, plus A$8,500 for one ICM Sewer seat = about A$86,500.

FlowSense at 50 sites: (20 × $30) + (30 × $20) = $1,200 a month, × 12 = $14,400.

Twenty and ninety sites: the same steps, set out in the table in the body of this document.

Five year gap at 50 sites: (5 × A$86,500) less (5 × $14,400) = about A$360,000. Ratios are rounded down where rounding matters.

Comparator pricing is as published by the vendor or as recorded in public municipal contract documents at August 2026, converted at approximately A$1.54 per US dollar and A$1.70 per euro and rounded. Those figures are indicative context, not quotations. Capability characterisations of other vendors are from their public material as at August 2026; "not published" should not be read as confirmation a capability or price is absent. Vendor names and product names are the trademarks of their respective owners.
